\$/109/61/006/009/006/018 D201/D302

$$\int_{a_{2}(\eta)}^{a_{3}(\eta)} \dot{A}(\xi, \eta) d\xi = k_{2} J_{2}(\eta), \tag{7}$$

where  $J_1(\xi)$ ,  $J_2(\eta)$  are the amplitude-phase distribution of linear antennae and  $k_1$ ,  $k_2$  are constants. These two equations may be considered as a system which permit the synthesis of plane aperture antennae from known, in the main planes, directivity patterns.  $J_1(\xi)$  and  $J_2(\eta)$  are, therefore, considered to be known and the possibility of determining  $A(\xi,\eta)$  and  $b(\xi)$  is explored with the aim of applying the design procedure of linear antennae to that of plane aperture antennae. Two kinds of amplitude-phase distributions are then considered. The first kind when the amplitude phase characteristic can be represented by explicit distributions of both amplitude and phase as in

 $\dot{A}(\hat{S}, \gamma) = \dot{A}_1(\hat{S}) \dot{A}_2(\gamma)$ 

Card 3/8

T/Li

S/109/61/006/009/006/018 D201/D302

and the second when both remain implicit in the expression for A( $\S$ ,  $\eta$ ). For explicit representation two types of problems are considered. 1) The aperture (b( $\S$ )) is symmetrical with respect to axis. a) In phase symmetrical distribution. The author concludes here that the effective distribution  $J_{\gamma}(\S)$  is equal to the distribution of a plane antenna in the direction of the  $\S$  axis, multiplied at every point by a quantity proportional to the effective moment of the cross section in  $\eta$  axis direction. b) Asymmetrical in phase distributions. The evaluation of amplitude phase distribution is carried out. c) Symmetrical out-of-phase distributions. For an odd phase distribution  $\Psi_2(\eta)$  the basic equation has the form of

$$A_{1}(\xi)e^{i\phi_{1}(\xi)}\int_{0}^{b(\xi)}A_{2}(\eta)\cos\psi_{2}(\eta)d\eta = J_{1}(\xi)e^{i\phi_{1}(\xi)}.$$
(12)

It follows that  $\Psi_1(\xi) = \Psi_1(\xi)$  and  $\Psi_2(\eta)$  influences the effective amplitude distribution. 2) The second type of problem is when the

Card 4/8

XX

25;23 S/109/61/006/009/006/018 D201/D302

aperture is symmetrical with respect to both  $\xi$  and  $\eta$  axes. With inphase symmetrical distribution, the problem reduces to a set of two simultaneous equations

$$A_{1}(\xi) \int_{0}^{b(\xi)} A_{2}(\eta) d\eta = k_{1}J_{1}(\xi), \qquad (13)$$

$$A_{2}(\eta) \int_{0}^{a(\tau)} A_{1}(\xi) d\xi = k_{2} J_{2}(\eta), \qquad (14)$$

When the distribution is implicit, the knowledge of it in one plane does not result in much information about the distribution in other planes, so that the solution of problems of implicit distribution is hardly possible and only one case is considered, i.e. that of symmetrical in-phase distribution, for which

$$\int_{0}^{\langle \xi \rangle} A(\xi, \eta) d\eta = J_{1}(\xi). \tag{21}$$

Card 5/8

W

5/109/61/006/009/006/018 D201/D302

Design of plane aperture antennae

is given, which has to be solved. If  $A(\xi, \eta)$  is given then after integrating (21) an expression is obtained for finding  $b(\xi)$ . When  $b(\xi)$  is given, Eq. (21) in its general form cannot be solved as an infinite number of solutions can be obtained. The following solutions of Eq. (21) are recommended: a)

$$A(\xi, \eta) = \sum_{k=0}^{N} \frac{a_k}{F_k \{b(\xi)\}} f_k(\eta) J_1(\xi), \qquad (22)$$

in which  $f_k(\eta)$  - an arbitrary, easily integrated function;

$$F_k(\xi) = \int_0^{\xi} f_k(\eta) d\eta;$$

b) 
$$A(r_1) = -\frac{dJ_1[a(1-r_1)]}{dr_1}$$
 (23)

where  $r_1 = 1 + \eta - b(\S)$ ; Card 6/8

X,

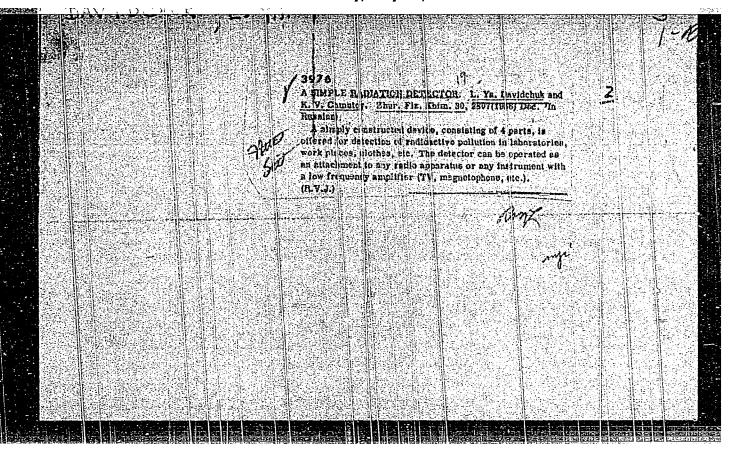

28523 S/109/61/006/009/006/018 D201/D302

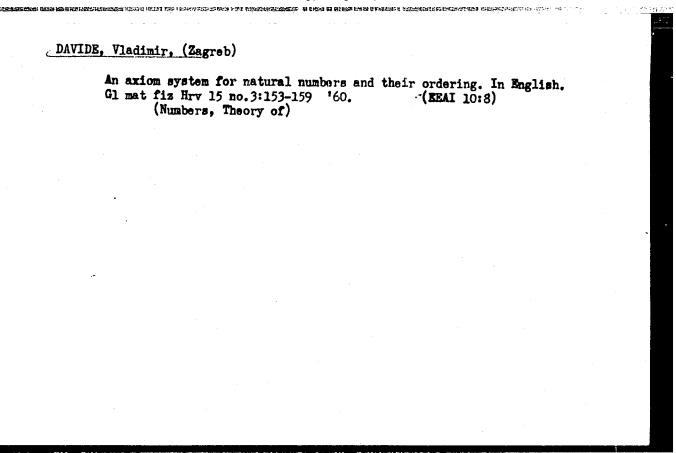

$$A (r_2) = \frac{2}{\pi} \left[ \frac{J_1[a(0)]}{V_1 - r_{\beta}^2} - \int_{r_4}^{1} \frac{dJ_1[a(V_1 - Z_1)]}{|V_2|^2 - r_{\beta}^2} \right], \tag{24}$$

where  $r_2 = \sqrt{1 + \eta^2 - [b(\xi)]^2}$ ;  $a(\eta) = a$  function inverse of  $b(\xi)$ . Finally the "artificial" rocking of the beam is considered. This method can be successfully applied to visualize to full directional pattern from one plane only. Since a linear phase shift produces the shift of the main lobe and of the whole of the pattern in the generalized system of coordinates

$$\int_{0}^{b(\xi)} A(\xi,\eta) \cos \alpha \eta d\eta = J_{1\alpha}(\xi). \tag{25}$$

represents, in fact, the effective distribution of a linear antenna, whose directional pattern coincides with that of a plane aperture antenna in the cross section plane  $u_2=\alpha$ . Taking different  $\alpha$  the patter can be studied for any required number of cross sections. Card 7/8

AUTHOR DAY

On a difference method for the solution of the Laplace equation

with axial symmetry.

PERIODICAL

Doklady Akad. Nauk 110, 910-913 (1956)

reviewed 3/1957

In a domain G of the r,z-plane which is limited by the curve  $\Gamma$ , the solution of the equation

 $\Delta u = \frac{1}{r} \frac{\partial u}{\partial r} + \frac{\partial^2 u}{\partial r^2} + \frac{\partial^2 u}{\partial z^2} = 0$ 

is sought which satisfies the condition  $u|_{\Gamma} = \gamma$ . G is covered by a net of lines, where the lines intersect in  $\alpha_i(r_i,z_i)$ . The solution is assumed in the neighborhood of  $\alpha_0(r_0,z_0)$  to be in the form

(1) 
$$u(r,z) = a_{0,0} + \sum_{n=1}^{\infty} [a_{n-1,1} \phi_{2n-1}(r,z) + a_{n,0} \phi_{2n}(r,z)],$$

where the  $\phi_i$  are certain harmonic functions and the coefficients  $a_{i,j}$  can be

Doklady Akad. Nauk 110, 910-913 (1956) CARD 2/2 PG -651

computed from conditions for the values of the derivatives of u and  $\phi_i$  in  $(r_0, z_0)$ . Setting up the representation (1) in all points  $\alpha_i$  and forming the linear combinations with suitable coefficients, then one obtains a difference equation which yields very exact values of u. An example is computed.

On the Solution of Laplace's Equation With Axial Symmetry TITLE:

by a Difference Method (K voprosu o reshenii Zaznostnym

metodom uravneniya Laplasa s osevoy simmetriyey)

Doklady Akademii Nauk SSSR, 1957, Vol. 114, Nr 4, PERIODICAL:

pp. 690-693 (USSR)

ABSTRACT: In a previous work (ref. 1) the author develops a difference

method for the solution of the axially symmetric Dirichlet

problem for the Laplace equation  $\Delta u = (1/r) \frac{\partial u}{\partial r} + \frac{\partial^2 u}{\partial r^2} + \frac{\partial^2 u}{\partial z^2} = 0$  (1). Here r denotes the radical coordinate and z the coordinate directioned along the symmetry axis. For the determination of concrete differential equations the author here constructed harmonic functions  $\Phi_{2n-1}(r,z)$  (n = 1,2,...) and  $\Phi_{2n}(r,z)$  (n = 0,1,...) by means of harmonic polynominals. Here the author obtains a further type of functions  $\Phi_{2n-1}(\mathbf{r},\mathbf{z})$  and  $\Phi_{2n}(\mathbf{r},\mathbf{z})$  and by means of these

new functions he constructs differential equations for 5 and for 9 points. At first the author endeavors to determine the

Card 1/3 function u(r, z) satisfying the equation (1) in the domain

1/ Predstavleno akademikom S.L. Sobolevym. (Harmonic functions)

On the Solution of Laplace's Equation With Axial Symmetry 20-114-4-4/63 by a Difference Method

G of the r, z-plane enclosed by the edge \( \begin{aligned} \text{and assumes given} \) values on \( \begin{aligned} \begin{aligned} \text{The domain G is covered by a quadratic net of the} \) spacing h and the coordinates of any node are denoted by ro,  $z_0$ . A lemma necessary for these investigations is given. The functions  $\Phi_{2n-1}(r,z)$  and  $\Phi_{2n}(r,z)$  can be constructed by the application of harmonic polynominals and further functions given here; they are written down explicitly for n = 0,1,2,3, 4. By means of these functions the differential equations for any number of nodes may be computed. The difference relations determined from 5 points are then given explicitly for a quadratical net of the spacing h. Also the differential relations determined from 9 points are written down ecplicitly. The linear system of equations can be obtained either by means of the iteration method or by successive groupwise elimination of the unknownby transforming the matrices. As a practical example the author investigates the determination of the electric field strength in the interior of a cylindrical cage. There are 3 references, 3 of which are Soviet.

TITLE:

A method of setting up difference equations when solving the internal Dirichlet problem for Poisson's equation by the

method of nets

PERIODICAL: Ukrainskiy matematicheskiy zhurnal, v. 13, no. 4, 1961, 92-96

TEXT: Sh. Ye. Mikeladze (O chislennom integrirovanii uravneniy ellipticheskogo i parabolicheskogo tipa, Izv. AN SSSR, ser. matem., t. 5, No. 1, 1941, 57 - 73), in solving the Dirichlet problem for Poisson's equation, found difference equations with an error of the order  $h^3$  for any boundary nodes, and of the order  $h^4$  for a special type of boundary nodes. The solution u(x,y), satisfying the Dirichlet condition at the boundary f, of Poisson's equation  $\Delta u = (\partial^2 u/\partial x^2) + (\partial^2 u/\partial y^2) = f(x,y)$  (1) and f(x,y) are assumed to have continuous and bounded derivatives up to the required order in the domain G. When G is covered by an arbitrary net, it must be possible to render (1) in the neighborhood of the point  $\alpha_0$  of G in the Card 1/5

30333 S/041/61/013/004/004/007 A method of setting up difference... B125/B112

form:  $u(x,y) = F(x,y) + a_{0,0} \Phi_0(x,y) + \sum_{n=1}^{\infty} \left[ a_{n-1,1} \Phi_{2n-1}(x,y) + a_{n,0} \Phi_{2n}(x,y) \right]^{\frac{1}{2}}$  $F(x,y) = \sum_{k,l=0}^{\infty} c_{kl}(x - x_0)^k (y - y_0)^{l+2},$ 

 $c_{k1} = \frac{1}{k!(1+2)!} \sum_{j=0}^{E(\frac{1}{2})} (-1)^{j} \frac{\partial^{k+1} f(x,y)}{\partial x^{k+2} j_{\partial y}^{1-2j}} \Big|_{y=y_{0}}^{x=x_{0}} \cdot \alpha_{0} = \alpha_{0}(x_{0},y_{0}) \text{ is an}$ 

arbitrary node of the net, and  $\alpha_i = \alpha_i(x_0 + k, y_0 + l_i)$  denotes the nodes closest to m.  $k_i$ ,  $l_i$  are certain numbers. In analogy to a paper of I. Albrecht and W. Uhlmann (Z. angew. Math. Mech., 37, 1957, 212 - 224), the

difference equation  $u(x_0,y_0) + \sum_{i=1}^{m} b_i u(x_0 + k_i, y_0 + l_i) = Q^{(m)}(f) + R^{(m)}(0,0)$ (2) is derived for the m+1 nodes of the net. The coefficients  $b_i (i = 1,2,...,m)$  are defined as solution of the linear equations Card 2/5

A method of setting up difference...

30833 S/041/61/013/004/004/003 B125/B112

 $\frac{m}{\sum_{i=1}^{m} b_{i}} b_{i} c_{0}(x_{0} + k_{i}, y_{0} + l_{i}) = -1, \quad \frac{m}{\sum_{i=1}^{m} b_{i}} c_{q}(x_{0} + k_{i}, y_{0} + l_{i}) = 0,$   $q = 1, 2, ..., m-1. \text{ In addition, } c_{m}(f) = \sum_{i=1}^{m} b_{i} F(x_{0} + k_{i}, y_{0} + l_{i}). \text{ As}$ 

the remainder is sufficiently small, the difference equation has the form:  $u(x_0, y_0) + \sum_{i=1}^{m} b_i u(x_0 + k_i, y_0 + l_i) = \sum_{i=1}^{m} (f)(3)$ . The system of N

linear algebraic equations with N unknown quantities, which results from the determination of (3) for each of the n nodes of the net, enables one to determine the approximate value of u(x,y) for all nodes inside G from the given values of u at the boundary. The homogeneous harmonic polynomials

TITLE: On the estimation of the error in solving the Dirichlet problem for the Laplace equation by means of nets

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 138, no.2, 1961, 267-270

TEXT: In the n-dimensional region D with the boundary S the author considers the equation

$$\Delta u = \sum_{\nu=1}^{n} \frac{\partial^{2} u}{\partial x_{\nu}^{2}} = 0$$
 (1)

with the condition  $u|_s = f$ . Taking in D a net with the step h and replacing  $\Delta$  by a difference operator  $\Delta_h$  s

 $\Delta_h u = \Delta_u + R(u) \tag{2}$ 

then the strong solution u of (1) can be approximated by numerical solution  $\overline{\mathbf{v}}_{h}$  of Card 1/4

X

On the estimation of the error ... S/020/61/138/002/004/024

$$\Delta_h \nabla_h = 0$$
,  $\overline{\nabla}_{h/S} = f$ . (3)

Theorem 1 s In the n-dimensional region D with the boundary S let two functions u and v be defined which assume the same value f on S. Let u be continuous in D + S and harmonic in D; let the function v be continuous in D + S together with its first and second derivatives, where in D

$$|\Delta v| \leq E$$
,  $E = const.$ 

Then in D it holds

$$|u - v| \le y E$$
 ,  $\frac{1}{y} = 2 \sum_{p=1}^{n} \frac{1}{a y^2}$  ,

where ay (y = 1,2,...,n) are the semiaxes of the n-dimensional ellipsoid L in which the region D is contained. Conclusion s If in theorem 1 instead of the harmonic function a function u is considered which In D satisfies the Poisson equation

$$\Delta u = \varphi(x_1, x_2, \dots, x_n) \tag{4}$$

TITLE:

Construction of difference equations in solving approximately the Euler-Poisson-Darboux equation

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 142, no. 3, 1962, 510-513

TEXT: The method proposed in the paper of D.F. Davidenko (Ref. 1: DAN, 110, no. 6, 910 (1956)) is used for solving the problem  $u \mid \Gamma = \varphi$  for the equation

 $\Delta_{k}^{u} = \frac{k}{r} \frac{\partial u}{\partial r} + \frac{\partial^{2} u}{\partial r^{2}} + \frac{\partial^{2} u}{\partial z^{2}} = 0 \quad . \tag{1}$ 

If  $\phi_0' = \phi_0'(r_0, z_0)$  is a nodal point of an arbitrary net, then it is assumed that in the neighborhood of  $\phi_0'$  the representation

$$u(\mathbf{r},\mathbf{z}) = a_{0,0} \phi_0^{(k)}(\mathbf{r},\mathbf{z}) + \sum_{n=1}^{\infty} \left[ a_{n-1,1} \phi_{2n-1}^{(k)}(\mathbf{r},\mathbf{z}) + a_{n,0} \phi_{2n}^{(k)}(\mathbf{r},\mathbf{z}) \right]$$
(2)

Card 1/2

Construction of difference equations ... S/020/62/142/003/002/027

is possible, where  $\phi_0^{(k)}(\mathbf{r},z)\equiv 1$  ,  $\phi_{2n-1}^{(k)}(\mathbf{r},z)$  ,  $\phi_{2n}^{(k)}(\mathbf{r},z)$  are linearly independent functions satisfying (1) and the conditions from (Ref. 1), and where the coefficients a are determined from conditions corresponding to (3), (4) in (Ref. 1). The representation (2), as in (Ref. 1), is used for setting up difference equations which approximately replace (1). The author sets up five-point difference equations for arbitrary nodes in the case of a quadratic net, where the error for an arbitrary node has the order h3 and for an internal node the order h4. The author gives ninepoint difference equations for the internal nodes of a quadratic net; the error has the order h8 for nodes which do not lie on the symmetry axis  $(k \neq -2)$  and the order h<sup>6</sup> for nodes on the axis. The various difference equations are obtained by using different systems of functions  $\phi^{(k)}(r,z)$ . L.V. Kantorovich is mentioned in the paper. There are 6 Soviet-bloc references and 1 non-Soviet-bloc reference. PRESENTED: September 9, 1961, by S.L. Sobolev, Academician SUBMITTED: July 7, 1961 Card 2/2

Doklady, v. 162, no. 4, 1965, 743-746 TOPIC TAGS: approximation calculation, differential equation, matrix algebra ABSTRACT: The author constructs higher accuracy iteration formulas for making more precise the approximate values of the inverse matrix  $A^{-1}(\lambda)$  obtained by the method. of variation of parameters (or some other method). He also uses variation of parameters, which involves construction of a differential equation satisfied by 4" (A), which is numerically integrated. Convergence to the desired result occurs even in cases where other known iteration formulas fail. Orig. art. has: 9 formulas. ASSOCIATION: Institut atomoy energii im. I. V. DAVIDENKO, I. A.

At the Dnepropetro-sk-Mining Institute in Artem Sergeyev from April 1939 to April 1947, the following dissertations were defended in connection with attaining the scholarly degree of Candidate of Technical Science (specializing in mining electrical engineering: I. A. Davidenko on 29 July 1940 defended his dissertation on the subject "Magnetic defectoscopy for lifting cables".

The official opponents of this dissertation were the late Doctor of Technical Sciences Professor V. B. Umanskiy and Candidate of Physical-Mathematical Sciences I. I. Teumin.

A length of cable was investigated, made of twisted steel wire, which was magnetized by placing a coil upon it which was driven at a constant speed. The magnetizing winding was supplied with direct current. The coil also possessed a secondary winding. Defects in the cable (broken wires, abrasion) caused a change in the magnet current. The electromotive force in the second winding was amplified and recorded on an oscillograph. As a result it was determined that the sensitivity of the method is limited by the non-homogeneous structure of the cable and not by the recording instruments, as was supposed previously.

flax. The dusting of the seeds increased field germination and the density of the stems when the crop was harvested. HCCH stimulated the growth of flax in the first 3 weeks, increased the yield of straw and of seeds, of the fiber output and its quality. When 10% chlordane dust (200 kg/ha) was applied to leached out turf-carbonated clayey soil, the number of larvae of the eastern May beetle, Melclontha hippocastani F., decreased 79%, when 25% HCCH dust was placed (85 kg/ha) they were decreased by 71%; the field germination of sugar beet seeds increased 9%; 2.75% of the plants were damaged by the flea beetles (37.8% in the control); the yield of beets increased by 38.7% (18.6% from HCCH). -- A. P. Adrianov.

THE REPORT OF THE PROPERTY OF

TITLE:

Anisotropy of the longitudinal thermomagnetic Nernst-Ettingshausen-effect in magnetite in the low-temperature

transition region

PERIODICAL:

Fizika tverdogo tela, v. 3. no. 6, 1961, 1650 - 1653

TEXT: The crystal structure of magnetite is modified at about 120°K, and, as a consequence, all physical properties are practically changed. In connection with the theory by Verwey et al. (J. Chem. Phys. 15, 181, 1947), in which the 3d electrons are assumed to rearrange in the transition point, it is of interest to study the anisotropy of various properties of magnetite, as it may serve to verify the theory. The authors studied the anisotropy of the longitudinal thermomagnetic Nernst-Ettingshausen effect (1.th. N-E.E.) in the transverse magnetic field. A report is given of relative results. For measuring the 1.th.N-E.E., the sample was introduced into a cryostat cooled with liquid nitrogen.

Card 1/4

Anisotropy of the longitudinal ...

By two heaters at the sample ends, it was possible to establish any temperatures between 77 and 200°K. Two copper-constantan thermocouples served for measuring the temperature. The samples were cut from natural magnetite single crystals and had a cylindrical shape (3 mm in diameter, 10-15 mm long) with the axis parallel to the [110] direction (the orientation was checked roentgenographically). Temperature gradient and direction of the measurement of the 1.th.N-E.E. likewise coincided with the [110] direction. The constant magnetic field of 20,400 oe was in the (110) plane, perpendicular to [110]. During the measurement of the 1.th.N-E.E. the samples were rotated about the axis by 360°, first in one, then in the opposite direction, and a measurement was made every 10°. The mean values were then calculated from four measured values at each point. The anisotropy of the 1.th.N-E.E. was measured on five samples in the 90 - 160°K range. Fig. 1 presents the 1.th.N-E.E. as a function of the orientation of the magnetization vector with respect to the [001] direction; the relative change of the thermo-emf in the magnetic field, which is related to the value of the 1.th.N-E.E. by the relation  $\Delta \propto \Delta = E_{N-E} / (\Delta T/\Delta x)$ , is taken as the ordinate. The study
